WHY USING WORKFLOW?

DATA & AI LANDSCAPE 2019

DATA & AI LANDSCAPE 2019

WHY USING WORKFLOW?

Replicable, Reproducible, and Expandable

WHY USING WORKFLOW?

Re-execution of R code in datasets published at Harvard Dataverse

About **84%** re-executions are failed!!!

WHAT IS WORKFLOW?

*A typical workflow for a data science project, including **data preparation** (extraction, cleaning, and understanding), **analysis** (modeling), **reflection** (finding new paths), and **communication** of the results to others. (<https://sciforce.solutions/>)*

- **Easy to Operate**
- **Without Programming Knowledge**
- **Modulization**
- **Sharable**
- **Reproducible**
- **Replicable**
- **Expandable**

Introduction on Workflow Tool KNIME

<https://www.knime.com/>

- ❑ Workflow is displayed as connected nodes which make it easy to troubleshoot and visualize
- ❑ Easy to use without much knowledge of coding
- ❑ Great extensions for data preprocessing, analysis, and visualization
- ❑ Connection to other languages, such as JS, R, Python, etc.
- ❑ Open-source
- ❑ Cross platform interoperability
- ❑ Have a decent size community that supports Q&A.

Introduction on Workflow Tool KNIME

❑ Download KNIME <https://www.knime.com/downloads/download-knime>

❑ KNIME Interface

The screenshot displays the KNIME Analytics Platform interface. The main window shows a 'Welcome back' message and three promotional cards: 'Share your workflows and components on KNIME Hub', 'KNIME Courses: learn all about Big Data, Text Mining and more', and 'Questions? Ask the community'. The interface is annotated with five red text labels: '1. Project Files' points to the 'KNIME Explorer' sidebar; '2. Workflow Workspace' points to the main content area; '3. Nodes' points to the 'Node Repository' sidebar; '4. Outline' points to the 'Outline' panel; and '5. Console' points to the 'Console' panel at the bottom right. The console shows a welcome message and the log file location: 'F:\CDL\knime\metadata\knime\knime.log'.

Case Study One: Spatiotemporal Data Visualization

□ Steps for Running the Workflow

Step 1: Download data from Google drive [data folder](#)

Step 2: Download workflow from Google Drive [workflow folder](#)

Step 3: Open KNIME from local PC or China Data Lab Cloud Platform (in building)

Step 4: Import Knime workflow file (pop_maps_china.knwf)

Step 5: Launch the workflow by double clicking the imported workflow

Step 6: Configure “Input Data” by selecting “China_Province.csv” and “8.POP.xlsx”

Step 7: Configure “Set Variables”

- Select Geojson file ‘China_admin_1.json’ path;
- Set Output html, GIF, and MP4 file path;
- Set Option: 1->html; 2->GIF; 3->mp4
- Set Title: name of the html file
- Set Days interval: default 3;

Step 8: Configure path in “Image Write” node

Step 9: Click Run  function from the top menu

Step 10: Display the outputs:

- HTML Map
- GIF Map
- MP4 Map
- Chart

*** Please install plotly, imageio, and opencv python library before running the workflow

ABSTRACT

Keywords:
 Regional inequality
 Spatial hierarchy
 Multilevel modeling
 GIS
 China

This paper advances the multi-scale and multi-mechanism framework of regional inequality in China by using the most recent statistical data. We analyze the multi-scalar patterns of China's regional inequality with GIS and statistical techniques, and demonstrate the significance of the municipality effect. The authors also apply multilevel modeling to identify the spatial structure and time dimension of the underlying forces driving regional development. This study illustrates that China's regional inequality is sensitive to the spatial-temporal hierarchy of multi-mechanisms, and reveals the relative influence of globalization, marketization, and decentralization.

Introduction

China has been experiencing a gradual transition from a command economy to a market economy, and has achieved tremendous economic growth in the last three decades. At the same time, the uneven process of economic development among regions has also been intensified. Regional inequality has become a serious issue attracting considerable attention from both the government and researchers.

Regional inequality is an important issue of government policies (Wei, 2002). The Chinese government's regional policies and strategies have been changing in order to effect economic transition and social development. Since the government launched the open-door policy in 1978, China has maintained a comparative advantage and an open-door policy that focus on growth of the coastal regions to attract foreign investment and stimulate economic growth. To further the economic reform, in 1992 Deng Xiaoping, the leader of China, proposed "socialist marketization" and advocated establishing various types of enterprises besides state-owned enterprises. In the last decade, due to the increasing economic gap among regions, the Chinese government has paid more attention to solving economic polarization and endorsing programs to alleviate

Case Study One: Regional inequality of China

- Methodology: to understand China's regional inequality, **multilevel regression modeling** is applied to examine the underlining mechanism

$$y_{ijt} = \beta_0 + \beta_1 x_{ijt} + u_t + r_{jt} + e_{ijt}$$

single-level (province), two-level (region and province) and three-level (time, region, and province)

Full Length Research

Unconditional convergence of Chinese provinces (1952-2017): Some statistical analysis results

Ming-Lu Wu

Division of Business and Management, United International College (UIC), Beijing Normal University-Hong Kong Baptist University, 2000 Jintong Road, Tangjiawan, Zhuhai, Guangdong 519085, P. R. China.

Received 25 February, 2020; Accepted 27 March, 2020

This research tests the economic convergence hypothesis of 31 inland Chinese provinces over the period from 1952 to 2017. Regression and descriptive analysis methods are adopted to study the economic convergence among these Chinese provinces in terms of GDP growth and per-capita GDP growth. The research results show that GDP growth does not exhibit a tendency of convergence, rejecting the absolute convergence hypothesis among the Chinese provinces. But per-capita GDP growth does suggest convergence, especially after China's economic reform from 1978 to 2017, supporting the relative convergence hypothesis among the Chinese provinces. Practical and policy implications are provided based on the research results.

Key words: Economic convergence, regression, descriptive analysis, GDP, per-capita GDP, China.

INTRODUCTION AND RESEARCH BACKGROUND

The idea of economic convergence

As directly implied by the assumption of diminishing

same exogenous parameters of economic growth across regions, their initial levels of per capita income (or equivalently, per capita capital stock) are not

GDP (St-Dev/Average)

Figure 2. Relative variation of 31 Chinese provinces' GDP.

Table 1a. Test of absolute convergence from 1952 to 2017.

$\ln(\text{GDP}_{2017}/\text{GDP}_{1952}) = a + b \cdot \ln(\text{GDP}_{1952})$				
Parameter	Estimate	Standard error	t-value	p-value
Intercept (a)	7.4489	0.2534	29.3958	0.0000
Slope (b)	-0.0969	0.0882	-1.0986	0.2813
R-Square	0.0414			

Case Study Three: Unconditional Convergence of China

- ❑ **Methodology:** regression model of growth rate was used but for all 31 mainland provinces in China

$$\ln(\text{GDP}_{2017}/\text{GDP}_{1978}) = a + b \cdot \ln(\text{GDP}_{1978})$$

$$\ln(\text{GDP}_{2017}/\text{GDP}_{1952}) = a + b \cdot \ln(\text{GDP}_{1952})$$

$$\ln[(\text{GDP per capita } 2017)/(\text{GDP per capita } 1952)] = a + b \cdot \ln(\text{GDP per capita } 1952)$$

$$\ln[(\text{GDP per capita } 2017)/(\text{GDP per capita } 1978)] = a + b \cdot \ln(\text{GDP per capita } 1978)$$

Table 1B - Test of Absolute Convergence from 1978 to 2017

Table 2A - Test of Relative Convergence from 1952 to 2017

Table 2B - Test of Relative Convergence from 1978 to 2017

Figures 2, 3 (St-Dev/Average) 4, 5 (Relative to Beijing, St-Dev/Average)

Figure 4 - GDP, Relative to Beijing (St-Dev)

Figure 5 - GDP Per Capita, Relative to Beijing (St-Dev)

Figure 2 - GDP (St-Dev)

Figure 3 - GDP Per Capita (St-Dev)

Case Study Two: Unconditional convergence of China

Relative variation and over Beijing of 31 Chinese provinces' GDP and GDP per capita

Test of absolute and relative convergence from 1952/1978 to 2017 using GDP and GDP per capita

Case Study Two: Unconditional Convergence of China

□ Steps for Running the Workflow

Step 1: Download data from Google Drive [data folder](#)

Step 2: Download workflow from Google Drive [workflow folder](#)

Step 3: Open KNIME from local PC or China Data Lab Cloud Platform

Step 3: Import KNIME workflow file (Convergence of Chinese Provinces Workflow.knwf) from the File menu

Step 4: Launch the workflow by double clicking the imported workflow

Step 5: Configure “Input Datasets” by Changing Location

Step 6: Click **Run** function from the top menu

Step 7: Display the outputs:

- **2 Interactive View: Linear Regression** for Test of absolute convergence from 1952 and 1978 to 2017 using GDP
- **2 Interactive View: Linear Regression** for Test of absolute convergence from 1952 and 1978 to 2017 using GDP per capita
- **2 Interactive View: Line plot** for Relative variation of 31 Chinese provinces' GDP and GDP per capita
- **2 Interactive View: Line plot** for Variation of 31 Chinese provinces' GDP and GDP per capita over Beijing's

Summary

- ❑ IBM predicted that the demand for data scientists will increase by 28 percent by 2020
- ❑ Everyone can be a data scientist
- ❑ Data Science Ecosystem
 - ❑ Sharing Data
 - ❑ Sharing Tools
 - ❑ Sharing Process
 - ❑ Sharing Knowledge
 - ❑ Intelligent Recommendation

The image displays the Spatial Data Lab interface. The top section features a dark blue background with a world map and the text "Spatial Data Lab" in yellow. Below this is a white login form with fields for "Please enter an account name", "Please enter your password", and a "Remember password" checkbox, followed by a blue "sign" button. To the left of the login form is a globe icon with "GDL" written on it. The bottom section shows a dashboard titled "Global Research on Novel Coronavirus" with a "web app" tab selected. The dashboard contains a grid of software icons including Nmap, QGIS, GeoDaSpace, QGIS3, Word, PowerPoint, Excel, ArcGIS, R, ArcMap, QGIS, StarUP, PostGIS, RStudio, pgAdmin, GRASS, CPLEX Studio, MEGA-X, BioEdit, KODON 4.1.2, ArcCatalog 10.7, ArcGlobe 10.7, and ArcScene 10.7. At the bottom right, the URL <http://chinadatalab.org/> is displayed.
